

# MLB-2500 Mercury Arc Lamp Driver

2500 Watts with Igniter

## Features:

- **2500 watts output**
- **Low ripple current <0.5%**
- **Reliable short-pulse igniter**
- **Power Factor >.98**
- **Analog interface**
- **CE certified: IEC 60601-1**
- **Low cost, compact size**

The MLB-2500 is a high-performance current source designed to operate and control Mercury short-arc lamps. The design incorporates a constant power topology to precisely control the wide swings in lamp impedance as the lamp transitions from a cold start to full temperature operation. To properly start the lamp, the remote igniter delivers a fast rise time, short pulse for reliable ignition and reduced lamp electrode wear.

The MLB-2500 features a user-friendly analog interface that allows for easy programming and monitoring of output settings, as well as advanced safety features such as over-voltage, over-current, and over-temperature protection.

With a compact design and high efficiency, the MLB series of Mercury short-arc lamp drivers are reliable and cost-effective solutions for a wide range of applications requiring high intensity lighting.

### Interface (15 pin D-Sub Female)

Pin#	Pin Name	Functional Voltage Level	Description
1	Lamp On/Off (input)	High = RUN = +5V to +15V Low = OFF = 0V	The Lamp On/Off function is the control function which turns the lamp on and off. When the lamp is turned on, a trigger and boost sequence will ignite the lamp and deliver current.
2	Current Limit	Analog Level, Default = 10V Default = 105% of $I_{outmax}$ .	The Current Limit Pin is used to limit the output current of the supply. The pin can be pulled lower through the use of an external resistor to Gnd to limit the output current of the supply.
3	Interlock (Input)	Open = OFF, Connect to GND = RUN	The Interlock function can be connected to external interlock switches such as door or overtemp switches.
4,9,15	GND		Interface Return
5	Vout Monitor (output)	0-10V = 0-Vout max.	The output voltage of the supply can be monitored by Vout Monitor.
6	Iout Monitor (output)	0-10V = 0-Iout max.	The output current of the supply can be monitored by Iout Monitor.
7	Pprogram (input)	0-10V = 20%-Pout max.	The power supply output power is set by applying a 0-10V analog signal to Pprogram.
8	Lamp Status	High = lamp off = 15V Low = lamp on = 0V	The status of the lamp can be monitored using this pin
12	-15V (output)		Auxiliary 200mA.
13,14	+15V (output)		Auxiliary 200mA.
